

## Back-End Dev Test

19<sup>th</sup> April 2021

### Overview

Hello amazing coders! Congratulations on being selected for an interview! This is a simple test for all of you to check and verify if you're our candidate to join our team. This will be a simple web app test using the requirements given in the job description. Follow the procedures carefully and best of luck!

### Developer Test

Develop a simple blogging application using **Express.js** and **MongoDB** or **Laravel** and **MySQL** with following features:

- \* Authenticated users can write blogs and attach multiple tags to them.
- \* Other authenticated users can comment on blogs.
- \* Only the creator of the blog will have the ability to update or delete that.
- \* Authentication has to be stateless using JWT or some other technique.
- \* Push your code in a new public repository on GitHub with name **<YOUR-NAME>-SAYBURGH-**

#### **BACKEND-TASK**

These are some bonus tasks, which means they're optional but will carry great importance if completed:

- \* BONUS: use GraphQL instead of REST.
- \* BONUS: implement token refresh functionality using cookie.
- \* BONUS: follow MVC pattern.
- \* BONUS: create another branch named development in your repository and do all the tasks there. Once done, merge the branch with master or main by creating a pull request.

A working API will suffice, front-end application is not necessary. Make sure to submit the task within deadline and avoid making common mistakes.

### Instructions

Complete the given tasks above properly, push your code to GitHub or GitLab repository, mail us the link and that's it!

Happy Coding!
